Mathematics with bagme

Every formula below is presentation MathML embedded directly in the HTML handed to bagme. The MathML reader turns the `<math>` subtree into glyphs through the OpenType-MATH engine, and — because the document is PDF/UA-2 — each one is tagged as a `Formula` structure element.

Inline

The Pythagorean relation $a^2 + b^2 = c^2$ holds for every right triangle, and the quadratic equation $ax^2 + bx + c = 0$ is solved by $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

Display

In display mode a big operator sets its bounds above and below:

$$\sum_{k=1}^{n} k = \frac{n(n+1)}{2}$$

An author can override the spoken fallback with the MathML `alttext` attribute; otherwise the `/Alt` text is derived from the token content.
