<img> with percentage width

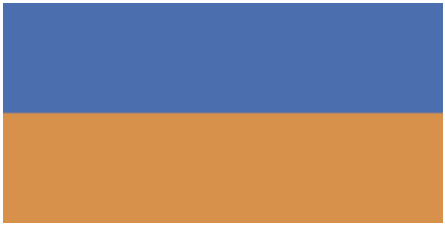
Same image (200×100 PNG, two horizontal stripes) placed in three containers via the deferred-sizing protocol. The same generalisation that handles inline SVG now also covers raster `<img>`.

Container A — page-wide, padded

Container B — narrow (heavy padding)

Container C — eager fixed width (regression check)

For comparison: same image with an absolute `width="120pt"` attribute. Aspect ratio is preserved.

Container D — 50% width


And the same image with `width="50%"`, sized against the paragraph's content width.
