Inline SVG with percentage width

Each chart below is the same SVG markup (`<svg width="100%" viewBox="0 0 100 30">…</svg>`) placed in a different container. The deferred sizer materialises each instance against its real container width.

Container A — page-wide, generous padding

Container B — half-width block (180pt)

Container C — eager absolute width (no sizer involved)

For reference, the same SVG rendered with an absolute `width="160pt"` attribute — no deferred sizing path; the geometry is fixed at parse time.

Container D — dashed stroke check

Confirms the `stroke-dasharray` patch is wired through to inline SVG as well.
