Three charts, three cells

Each cell below holds an inline `<svg width="100%">`. The DeferredSizer table-cell hook in `buildTD` materialises each SVG against the cell's `paraWidth` at table-layout time, so three different cell widths produce three different SVG widths.

Q1	Q2	Q3
Sales	**Returns**	**Mix**

Each SVG fills the full width of its cell. Because the three cells share equal layout, the three SVGs render at the same width — but the same markup would produce different widths in cells of different sizes (e.g. with `<col width>` once htmlbag's table layout honours that attribute end-to-end).
