Soft hyphen demo

Manual mode honours only explicit soft-hyphens, so the long word supercali-fragilisticexpialidocious can be split at the marked positions, but other long words like electroencephalography stay whole because no shy was provided.

Auto mode merges soft-hyphens with the English hyphenation pattern set, so supercalifragilisticexpialidocious now has both the user-supplied break points and the pattern ones, while electroencephalography also becomes breakable through the en patterns.

None mode treats soft-hyphens as zero-width text and forbids all breaks, so supercalifragilisticexpialidocious will

overflow the line rather than break — a brittle but spec- defined behaviour.
