PDF/UA-2 Showcase

What this document demonstrates

This PDF is generated as PDF 2.0 with PDF/UA-2 (ISO 14289-2) tagging enabled. Structure elements use the HTML5 namespace, so an accessibility tool sees the familiar `p`, `h1`…`h6`, and `figure` tag names instead of the PDF 1.7 capitalized role set.

Figure with alternative text

Figure 1 — the imported PDF rides in the HTML5 figure tag with the alt-text on /Alt.

What changed compared to UA-1

The PDF header is 2.0 and the /Info dict is omitted in favour of the XMP metadata stream. The MarkInfo dictionary is emitted with a proper typed Boolean `/Marked true`; the deprecated /Suspects entry is dropped (its default is false). The StructTreeRoot carries a /Namespaces array referencing both the HTML5 namespace and the PDF 2.0 Standard Structure Namespace; every structure element points at one of the two via its /NS entry.

Verifying the output

Run `pdfinfo 11-pdfua2.pdf` to see the PDF version, Title, Tagged flag, and Lang fields. For a full spec validation use `veraPDF` with the PDF/UA-2 profile.
